

Grid-locked features: activation locked to the icosahedral mesh, drawn as discrete mesh nodes (shade = mean amplitude)

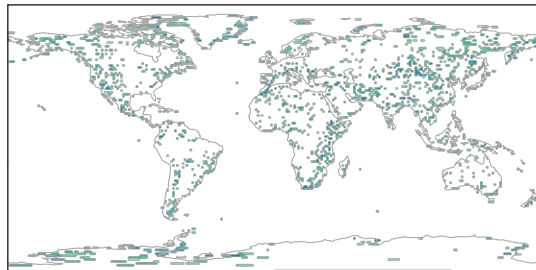

a f2954 — full lattice

load-bearing; +1.50 m z500, 19% of error

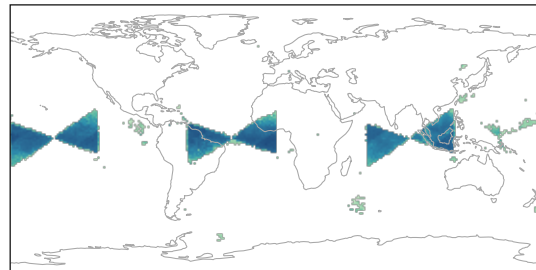

b f3404 — its matched control

equally grid-locked, costs +0.00 m

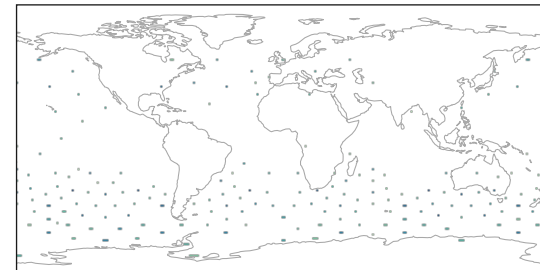

c f2075 — bowties

positional (rotation test), +0.06 m

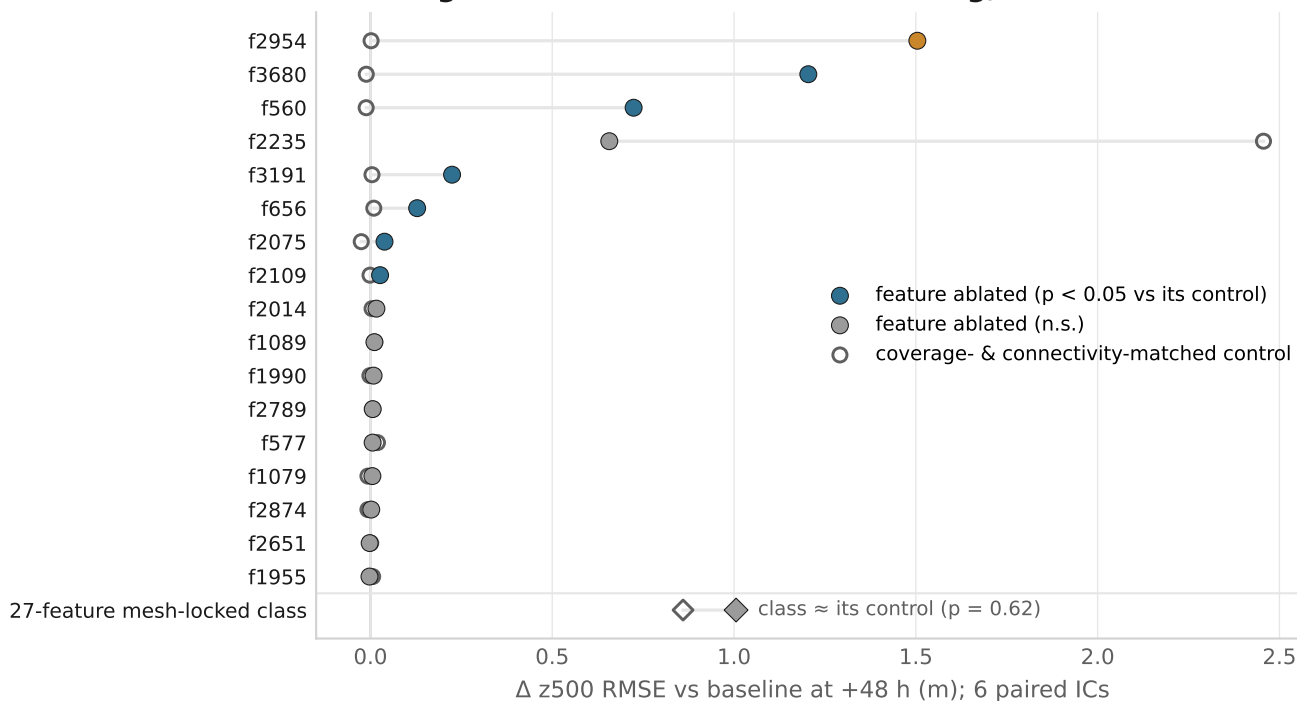

d f656 — lattice dots

positional, +0.12 m

e One grid-locked feature is load-bearing; the class is not

f Being mesh-locked is not what makes a feature matter
