

Generic initial states — concept dose

impulse $\gamma=1.0$ on 4 seasonal ICs; free 60 h roll

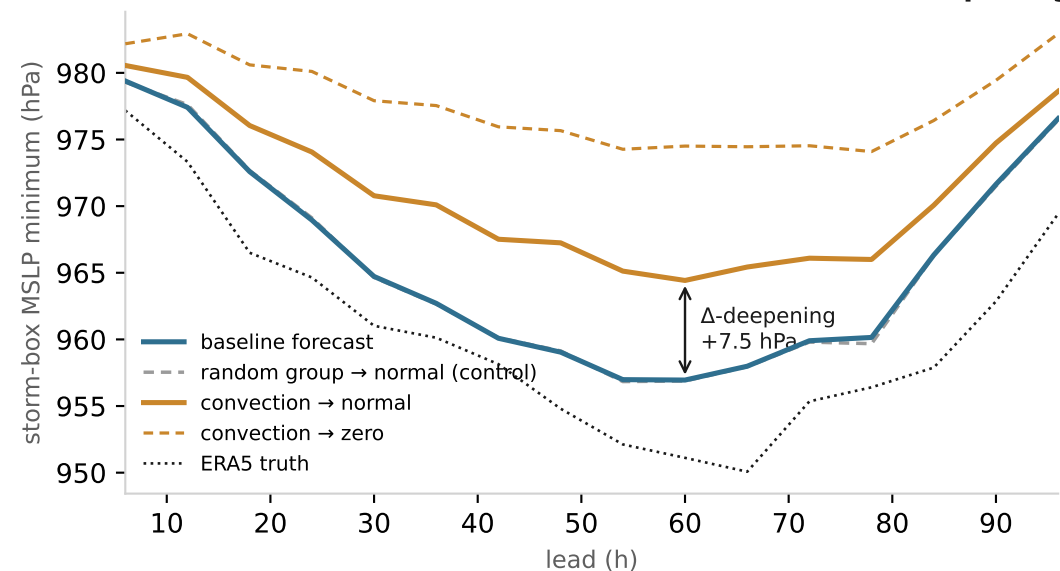

a Response magnitude: at the noise floor

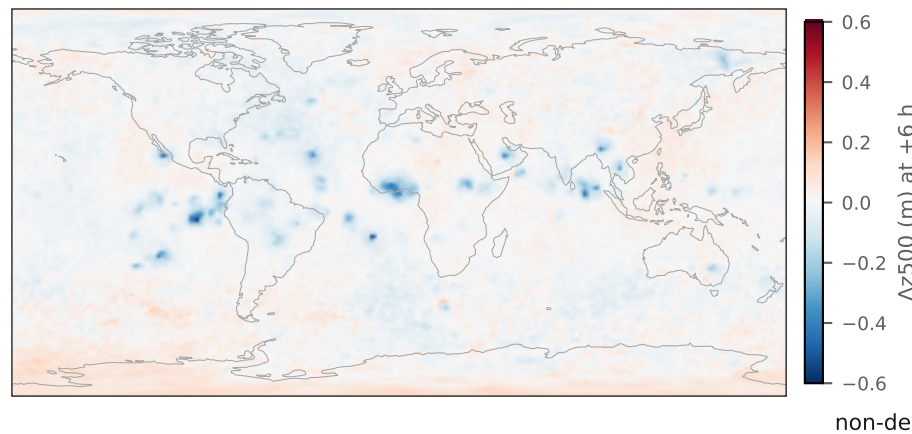

Hurricane regime — convection ablation

restore-to-normal in a 1500 km disk; free 96 h roll

b haishen 2020: the forecast loses a third of its deepening

c Ascent concept, mean response field at max SNR (+6 h): max $|\Delta z_{500}|$ 1.1 m against ± 100 -200 m synoptic anomalies; A50 0.02 — half the response in 2% of the globe, then float noise

d Seven storms: the lever is specific and event-locked
